Indiana University
C291/E111: System Programming with C and Unix
Instructor. Dongfang Zhao

Assignment submission through GitHub

Important Dates:

- This is a 0 marks assignment.

Objectives:

- Compile a C program using gcc
- Push the code to the GitHub repo
- Submit a link to the repo on canvas

What To Do:

In this assignment, you will compile and execute a c program and push it to your personal GitHub repository. This will help you prepare for your subsequent assignments.

Step 1: Navigate to the clone of your GitHub repository on silo by using `cd` and `ls` command.

Step 2: Create a new directory called assignment0

```
mkdir assignment0
```

Step 3: Copy the ".c" file you created during Wednesday lecture to the assignment0 directory. If you did not create the file on Wednesday, you can do it now. This ".c" file is referred to as `{source_file}` in this guide.

Step 4: Use gcc to compile and run your C program. Executable file(output_file) should be named main.out.

```
gcc {source_file} -o {output_file}
```

For example, if your source file name is *main.c*, you can type:

```
gcc main.c -o main.out
```

to compile `main.c` into an executable called `main.out`.

Step 5: Run the executable `main.out`:

```
./{executable_file}
```

For example, if you want to run an executable called `main.out`, Just type:

```
./main.out
```

Step 6: Commit and push your code to your GitHub repository. In orderto do

that, first all the changed files will be added:

```
git add .
```

To commit these changes, use following command:

```
git commit
```

The system will open a text editor for you to type in the commit message. You can put something like *"Finished assignment0"* or anything else you prefer.

After that, press Esc to get back to VI command mode. Type "`:wq`" command in VI, this should appear in the bottom most line of the editor. This will save the document and quit VI(w enables save mechanism and q performs quit in the command).

Alternatively, you can also just type **(Don't do this if you already used the above method):**

```
git commit -m "{commit_message}"
```

to avoid opening VI text editor.

For example, if the commit message is *"Finished assignment0"*, you can type:

```
git commit -m "Finished assignment0"
```

Step 7: Push the code from your local repository to your remote GitHub repository (your private repo on github.iu.edu).

```
git push origin "{branch_name}"
```

For example, for pushing the main branch you can just type:

```
git push origin main
```

Instructions for Submission:

Finally, you can go to your GitHub repository on your browser to check if the files have been pushed successfully. If so, please copy the URL of your remote GitHub repository from your browser bar and submit it on Canvas
